

(a) Main effect of each factor (table 3)

■ Fiducial-point ΔT ■ Decomposition RI (frozen)
 ■ Decomposition ΔT (frozen) ■ Early amplitude ratio

(b) Single-factor sweep (table 3b)

Values in tables 3 and 3b (descriptive, planned before the run). Main effect, mean at +1 SD minus mean at -1 SD of the factor, divided by the stratum mean (within age strata, %). In parentheses, within-stratum Spearman ρ between the factor and the two decomposition indices (table 3). (b) Subjects with the other five factors at reference; median over age strata.
