

Grey dashed line, criterion 0.30. Fiducial-point values (database-supplied; open diamonds) come from noise-free beats and are therefore placed at 0 % only (a rerun of the fiducial points on the noisy beats has not been done; its tier-B values at 1 % and 2 % are in table 9). Numbers in the tier-A panels, pass rate (remaining in tier A) at noise 0 / 1 / 2 %.

Tier A, subjects accepted by the method itself; tier B, subjects accepted by every compared method; tier C, all subjects regardless of acceptance

Tier B, 732 subjects (388 at 1 %, 323 at 2 %): the intersection of the subjects accepted by all three fits, a subset favourable to the decomposition. Tier C, 3,378 type-3 subjects. Values in table 9.

Exploratory, post hoc analysis; not used for the prespecified decision. Using an improved fit as a primary analysis would require a new preregistration.
